

# Introduction

Amin Farjudian<sup>1</sup>

Halmstad University

DT8014 Algorithms Course, Autumn 2016

---

<sup>1</sup>Originally by Masoumeh Taromirad.

# Outline

## The Course

- General Objectives
- Intended Learning Outcomes
- Sessions
- Exercises and Project
- Examination
- Course Materials
- Tentative Schedule

## Why Algorithms?

- Motivating Example
- Algorithms
- Tractability and P vs NP
- Computational Complexity
- Next Sessions ...

## Exercise

# General Objectives

Deepen and broaden knowledge of

- ▶ algorithm analysis
- ▶ algorithm design
- ▶ advanced classical data structures

With the help of

- ▶ overarching concepts
- ▶ concrete examples
- ▶ mathematical tools
- ▶ formal algorithm description

# Intended Learning Outcomes

- ▶ Knowledge and Understanding
  - ▶ explain selected advanced data structures
  - ▶ explain concepts of complexity analysis
  - ▶ describe selected approaches to dealing with intractable problems
- ▶ Skills and Ability
  - ▶ given a formal description of an algorithm prove e.g. its correctness
  - ▶ formulate an algorithm to solve a given problem using a given technique
  - ▶ select appropriate data structures and algorithms for given problems
- ▶ Judgement and Approach
  - ▶ trade-off between competing aspects when selecting, designing, and implementing data structures and algorithms
  - ▶ compare variants of data structures and algorithms on concrete problems

1. Lecture Sessions: 2-hour sessions per week
  - ▶ lecture and discussion
  - ▶ in-class activity or quiz
  - ▶ short presentation by students (first half)
    - ▶ Each group chooses a topic
  - ▶ supervised project (second half)
  - ▶ 15-minute BREAK!
2. Lab Sessions: 2 hours per week

## 1. Exercises

- ▶ Weekly
- ▶ Deadline: the next lecture

## 2. Supervised project

- ▶ Second half of the course
- ▶ Pick a project (problem + solution)
- ▶ Weekly brief (oral) report
- ▶ *You* choose the implementation language, the focus is on formal properties of the algorithms.

- ▶ Written project report
- ▶ Oral exam

## 1. Main Textbook

- ▶ Kleinberg, Jon., Tardos, Eva., *Algorithm Design*, Addison Wesley, 2005

## 2. Other references:

- ▶ Dasgupta, S., Papadimitriou, C., and Vazirani, U., *Algorithms*, McGraw-Hill Education, 2006

## 3. Slides/Handouts, Exercise, Project

- ▶ on the Blackboard page of the course (hopefully).
- ▶ If not, then on [my page](#)
- ▶ updated weekly

# Course Material

## Recommended Reading Material

- ▶ Lecture slides by Kevin Wayne
  - ▶ <http://www.cs.princeton.edu/~wayne/kleinberg-tardos>
- ▶ Lectures by Tim Roughgarden (Stanford University)
  - ▶ On-line lectures on Coursera
    - Algorithms: Design and Analysis, Part 1
    - Algorithms: Design and Analysis, Part 2
  - ▶ Handouts of Design and Analysis of Algorithms Course (Stanford University)
- ▶ Wikipedia

# Tentative Schedule

<b>W</b>	<b>Topic</b>	<b>Exercise/Project</b>
36	Introduction	Ex: Stable Matching
37	Complexity and Graphs	Ex: Hamiltonian Graphs
38	Selected Graph Problems	Ex: Graph Implementation + BFS
39	Greedy Algorithms	Ex: Huffman Trees
40	Randomization	Project Selection (problem+solution)
41	Selected Proof Techniques	Ex: Two Algorithms Pr: Formulate Algorithm
42	Dynamic Programming	Pr: Implement + Analyze
43	Dynamic Programming	Ex: Two DP Problems Pr: Finalization

# Visiting exchange professor

- ▶ Professor Álvaro Freitas Pereira
  - ▶ <http://www.inf.ufrgs.br/~afmoreira>
- ▶ Federal University of Rio Grande do Sul (UFRGS), Brazil
- ▶ 3 Weeks: September 4th to September 25th
- ▶ Part of the Linnaeus-Palme collaboration between ITE and the Institute of Informatics at UFRGS.
- ▶ *A short course on NP-completeness*
- ▶ Invaluable opportunity

Any Question?

- ▶ Break...

Motivating Example

Algorithms

Tractability and P vs NP

Computational Complexity

Next Sessions ...

## Exercise

# Travelling Salesman Problem (TSP)

The problem

- ▶ a collection of places that need to be visited
- ▶ the distance to travel between each pair of places is known.
- ▶ **what is the shortest route that visits all of the places exactly once?**

A very practical problem in many contexts

- ▶ e.g. courier vehicles choosing routes to deliver parcels, rock bands planning tours, and even a designated driver dropping friends off
- ▶ the measurement between each pair does not have to be distance (e.g. the cost to travel between each pair)

- ▶ Maths:
  - ▶ What is *logically possible*.
- ▶ Computer Science:
  - ▶ What is *computable*.
    - ▶ i. e., for which there exists an *Algorithm*.
- ▶ Computational Complexity:
  - ▶ What is feasible.

# Tractability

- ▶ *Tractability* explores problems and algorithms that can take an infeasible amount of time to solve for large enough input sizes.
- ▶ A *tractable* problem is one which we can write programs for that finish in a reasonable amount of time.
- ▶ An *intractable* problem is one that will generally end up taking way too long (e.g. TSP).
- ▶ A very common approach is to give up on getting a perfect answer, and aim for an *approximately* correct answer (in a *heuristic* way).
- ▶ P vs NP problem
  - ▶ On Clay Mathematics Institute;
  - ▶ On Wikipedia.
  - ▶ Relation with Moore's law.

# Computational Complexity

- ▶ An abstraction of the length of time it takes to perform a computation.
- ▶ The *actual time* on a particular computer can be useful, but:
  - ▶ which computer
  - ▶ which language
  - ▶ how well-written the program is
  - ▶ ...
- ▶ Hence, we consider *complexity classes*.
- ▶ Example
  - ▶ Mergesort:  $O(n \log n)$ .

# In the next sessions ...

We will talk about

- ▶ concepts of complexity analysis
  - ▶ Asymptotic Complexity, Big-O Notation, Proof Techniques
- ▶ advanced data structures
  - ▶ Graphs
- ▶ approaches to deal with *intractable* problems
  - ▶ Greedy Algorithms, Randomization, Dynamic Programming

# Outline

## The Course

- Exercises and Project
- Examination
- Course Materials
- Tentative Schedule

## Why Algorithms?

- Motivating Example
- Algorithms
- Tractability and P vs NP
- Computational Complexity
- Next Sessions ...

## Exercise

# Stable Matching Problem

## Exercise 1<sup>2</sup>

- ▶ *Stable Matching Problem* is a problem of finding a stable matching between two equally sized sets of elements given an ordering of preferences for each element.  
A matching is a mapping from the elements of one set to the elements of the other set.
- ▶ Outcome is NOT an efficient algorithm
  - ▶ how the problem and a solution can be *formalized*
  - ▶ how *hard* it is to check if a suggested solution is stable
  - ▶ how many *possible matchings* there are
- ▶ Deliverable: written answers should be handed in the next session
- ▶ Complete description is available on the course web page

---

<sup>2</sup>Taken from DT8014, 2014

## In this session ...

- ▶ How the course is offered (format)
- ▶ Why we study algorithms
- ▶ What tractability refers to
- ▶ What the term *complexity* is used for and why
- ▶ What the course is about
- ▶ An exercise

Any Question?
