Testing and Verification (DIT085),  
Chalmers and GU, January 30, 2015

## Announcements

- ▶ Groups: 62 people registered in GUL (fewer sent emails); you need to **register** in order to get evaluated.
- ▶ Final Exam: March 17 at 08:30, **Closed book**
- ▶ Supervised instructions: from **13:00** to 16:45
- ▶ FAQ: [http://ceres.hh.se/mediawiki/DIT085\\_FAQ\\_2015](http://ceres.hh.se/mediawiki/DIT085_FAQ_2015)
- ▶ Tools: slight changes in the tools for **Phase 2**; check the course page.

# When?

## V Model

# When?

## Boehm's Curve

# Functional Testing

- ▶ functional testing:  
program is an input from a certain **domain** to a certain **range**
- ▶ **impossible** to check **all** input/output combinations:  
defining a coverage criterion to choose some **some**

## Boundary Value Testing

- ▶ boundary value testing: a test case for each combination of extreme (normal, out of bound) values

## Boundary Value Testing: Pros and Cons

- + straightforward test-case generation
- no sense of covering the input domain \*
- awkward for logical vars. \*
- only independent input domains \*
- not using white-box information

\*: Today's order of business.

## Weak Normal EC: Idea

- ▶ Define **equivalence classes** on the **domain (range)** of input (output) for **each** variable:  
(independent input)
- ▶ **cover** equivalence classes for the domain of **each variable**:  
single fault assumption
- ▶ **how many** test-cases are needed?
- ▶ also called: (equivalence, category) partition method

## Little Puzzle

What is the **minimal number** of tokens that are needed to be put in an  $m \times n$  **grid** such that each row and column contains at least one **token**?

**$\max(m,n)$ :**

Put token number  $i$  at  $(\max(i, m), \max(i, n))$ .

## Weak Normal EC: Idea

- ▶ Define **equivalence classes** on the **domain (range)** of input (output) for **each** variable:  
(independent input)
- ▶ **cover** equivalence classes for the domain of **each variable**:  
single fault assumption
- ▶ **how many** test-cases are needed?  
 $\max_x |S_x|$ .

## Mortgage Example (recap)

Spec. Write a program that takes three **inputs**: gender (boolean), age([18-55]), salary ([0-10000]) and **output** the total mortgage for one person

Mortgage = salary \* factor,  
where factor is given by the following table.

<b>Category</b>	<b>Male</b>	<b>Female</b>
Young	(18-35 years) 75	(18-30 years) 70
Middle	(36-45 years) 55	(31-40 years) 50
Old	(46-55 years) 30	(41-50 years) 35

## Weak Normal EC Testing

Category	Male	Female
Young	(18-35 years) 75	(18-30 years) 70
Middle	(36-45 years) 55	(31-40 years) 50
Old	(46-55 years) 30	(41-50 years) 35

- ▶ **age:** difficult! [18-30], [31-35], [36-40], [41,45], [46-50], [51-55]
- ▶ **salary:** [0-10000]
- ▶ **male:** as strange as boundary value! true, false

## Weak Normal EC Testing

**if (male) then return**

$((18 \leq \text{age} < 35)?(75 * \text{salary}) : (31 \leq \text{age} < 40)?(55 * \text{salary}) : (30 * \text{salary}))$

**else return**  $((18 \leq \text{age} < 30)?(75 * \text{salary}) : (31 \leq \text{age} < 40)?(50 * \text{salary}) : (35 * \text{salary}))$

Gender	Age	Salary	Output	Correct Out.	Pass/Fail
male	20	1000	75*1000	75*1000	P
female	32	1000	50*1000	50*1000	P
male	38	1000	55*1000	50*1000	P
female	42	1000	35*1000	35*1000	P
male	48	1000	30*1000	30*1000	P
female	52	1000	35*5000	too late!	F

## Strong Normal EC Testing

- ▶ cover the **all combinations** of equivalence classes for the domain of all variables:  
multiple fault assumption
- ▶ number of test-cases?  $\prod_x |S_x|$

## Strong Normal EC Testing

Category	Male	Female
Young	(18-35 years) 75	(18-30 years) 70
Middle	(36-45 years) 55	(31-40 years) 50
Old	(46-55 years) 30	(41-50 years) 35

- ▶ **age:** [18-30], [31-35], [36-40], [41,45], [46-50], [51-55]
- ▶ **salary:** [0-10000]
- ▶ **male:** true, false

## Strong Normal EC Testing

**if (male) then return**

$((18 \leq \text{age} < 35)?(75 * \text{salary}) : (31 \leq \text{age} < 40)?(55 * \text{salary}) : (30 * \text{salary}))$

**else return**  $((18 \leq \text{age} < 30)?(75 * \text{salary}) : (31 \leq \text{age} < 40)?(50 * \text{salary}) : (35 * \text{salary}))$

Gender	Age	Salary	Output	Correct Out.	Pass/Fail
female	20	1000	75*1000	70*1000	F
female	32	1000	50*1000	50*1000	P
female	38	1000	50*1000	50*1000	P
female	42	1000	35*1000	35*1000	P
female	48	1000	35*1000	35*1000	P
female	52	1000	35*5000	too late!	F

## Strong Normal EC Testing

**if (male) then return**

$((18 \leq \text{age} < 35)?(75 * \text{salary}) : (31 \leq \text{age} < 40)?(55 * \text{salary}) : (30 * \text{salary}))$

**else return**  $((18 \leq \text{age} < 30)?(75 * \text{salary}) : (31 \leq \text{age} < 40)?(50 * \text{salary}) : (35 * \text{salary}))$

Gender	Age	Salary	Output	Correct Out.	Pass/Fail
male	20	1000	75*1000	75*1000	P
male	32	1000	50*1000	75*1000	F
male	38	1000	55*1000	50*1000	P
male	42	1000	30*1000	55*1000	F
male	48	1000	30*1000	30*1000	P
male	52	1000	30*1000	30*1000	P

## Weak Robust EC

- ▶ includes weak normal; adds out of range test-cases for each variable
- ▶ number of test-cases?  
 $(\max_x |S_x|) + 2 * n$

## Weak Robust EC Testing

**if (male) then return**

$((18 \leq \text{age} < 35) ? (75 * \text{salary}) : (31 \leq \text{age} < 40) ? (55 * \text{salary}) : (30 * \text{salary}))$

**else return**  $((18 \leq \text{age} < 30) ? (75 * \text{salary}) : (31 \leq \text{age} < 40) ? (50 * \text{salary}) : (35 * \text{salary}))$

Gender	Age	Salary	Output	Correct Out.	Pass/Fail
male	17	1000	30*1000	too young!	F
female	56	1000	35*1000	too late	F
male	36	-1	55*-1	0	F
female	36	10001	50*10001	50*10000	F

## Strong Robust EC

- ▶ Same as strong normal but also checks for all out of range combinations
- ▶ number of test-cases?

$$\prod_x (|S_x| + 2)$$

## Strong Robust EC

**if (male) then return**

$((18 \leq \text{age} < 35)?(75 * \text{salary}) : (31 \leq \text{age} < 40)?(55 * \text{salary}) : (30 * \text{salary}))$

**else return**  $((18 \leq \text{age} < 30)?(75 * \text{salary}) : (31 \leq \text{age} < 40)?(50 * \text{salary}) : (35 * \text{salary}))$

Mostly similar faults to Weak Robust EC:

Gender	Age	Salary	Output	Correct Out.	Pass/Fail
male	17	1000	30*1000	too young!	F
female	56	1000	35*1000	too late	F
female	17	1000	35*1000	too young!	F
male	56	1000	30*1000	too late	F
male	36	-1	55*-1	0	F
female	36	10001	50*10001	50*10000	F
...					

## A Brief Comparison

$A \rightarrow B$ : Test-cases of  $A$   
(faults detected by  $A$ ) is a  
subset of those of  $B$ .

# Mortgage Case: #Test-Cases

test-cases/faults

# Mortgage Case: Detected Fault

# Mortgage Case: #Test-Cases/Fault

## Idea

- ▶ Considering the boundaries of each partition relevant
- ▶ Example:  
Robust worst case testing of partitions

## Strong Robust EC + Robust BV

Gender	Age	Salary	Output	Correct Out.	Pass/Fail
male	17	-1	30*-1	too young!	F 1
male	17	1000	30*1000	too young!	F 1
male	17	10001	30*10001	too young!	F 1
male	56	-1	30*-1	too late	F 2
male	56	1000	30*1000	too late	F 2
male	56	10001	30*10001	too late	F 2
female	17	-1	30*-1	too young!	F 3
female	17	1000	30*1000	too young!	F 3
female	17	10001	30*10001	too young!	F 3
female	56	-1	30*-1	too late	F 4
female	56	1000	30*1000	too late	F 4
female	56	10001	30*10001	too late	F 4

## Strong Robust EC + Robust BV (Cont'd)

# Problems

- ▶ Example:  
Strong EC + Robust BV  
number of test-cases:  
 $\sim \prod_x 4(|S_x| + 1)$ , whopping!

# Problems

- ▶ **>100** test-cases for the **mortgage** example
- ▶ **too many** for any **real-life** program  
e.g., 5 vars., each 5 partitions:  
~ **8 million** test-cases  
**1 sec.** for each test-case:  
**3 months testing!**

## Problems

- ▶ Problems:
  1. No **constraints** on the equivalence classes
  2. **Dependencies** among different variables not taken into account
  3. No **choice** among relevant classes (e.g., apply worst-case testing on some and boundary values on others)
- ▶ Solutions: Decision tables, classification trees

## Possible Solution: Pairwise Testing

- ▶ Pairwise testing: for each two variables and each two partitions of their valuations, there is at least one test case
- ▶  $T$ -wise testing: for each  $T$  variables and each  $T$  partitions of their valuations, there is at least one test case

## Idea

- ▶ Goal: Summarize the **logic** of the program (à la **Karnaugh maps**)
- ▶ Find a few **conditions** on input determining the **output behavior**
  - need not be independent
  - relaxing the independence assumption in all previous techniques
- ▶ Determine the **output actions** for each combination of condition evaluations
- ▶ also called: cause-effect graph testing, or tableau testing

## Basic Concepts

- ▶ Stub:
  - ▶ condition part
    - the most **dominating** conditions **first**
    - multi-valued** conditions and **special** cases **last**
  - ▶ action part
    - exceptions
    - preferably combined actions as new rows

Stub	Entry		
c1	F	T	T
c2	-	F	T
c3	-	-	F
a1	X	-	-
a2	-	X	-
a1;a2	-	-	X

## Basic Concepts

- ▶ Entry
  - ▶ columns are called **rules**
  - ▶ condition part: true, false, (possibly other values) or don't care
  - ▶ action part

<b>Stub</b>	<b>Entry</b>		
c1	F	T	T
c2	-	F	T
c3	-	-	F
a1	X	-	-
a2	-	X	-
a1;a2	-	-	X

## Basic Concepts

- ▶ Completeness check for independent variables
  - ▶ each don't care counts for two rules
  - ▶ there must be  $2^{|\{c_i\}|}$  rules  
(for  $n_i$ -valued conditions:  $\prod_i n_i$ )

c1	F	T	T
c2	-	F	T
c3	-	-	F
a1	X	-	-
a2	-	X	-
a1;a2	-	-	X

## Basic Concepts

- ▶ Completeness check for independent variables
  - ▶ each don't care counts for two rules

WC				X						
Robust WC			X							
EC							X			
Strong (Normal) EC									X	
(Weak) Robust EC						X				
Strong Robust EC								X		
Decision Table					X					X

## Basic Steps

Classification tree:

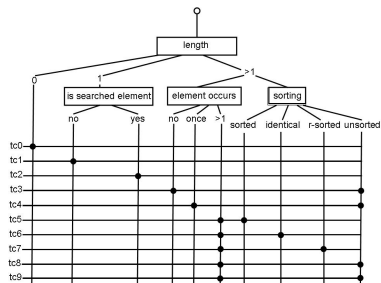

- ▶ Determine the **aspects** of specification influencing the **logic**
- ▶ Establish a **hierarchy** between aspects (the more **global** conditions **first**)
- ▶ **Partition** the input domain for each aspect  
**cover** the whole domain of the "parent" node

## Basic Steps

Combination table:

- Define a test-case for each relevant combination of inputs

## Example

### Informal Spec

Consider the function  $count(list : List(EI), el : EI) : int$ ,  
which takes a list of elements (with an order defined on them),  
and an element  
and output the number of occurrences of the element in the list.

# Mortgage Example

## Classes

1. Salary:  $-1$ ,  $[0..10000]$ ,  $>10000$ ,
2. Gender: Male, Female,
3. Age: Too young, Young, Middle, Old, Too old (**dependent** on gender)

## Functional Testing

- ▶ Equivalence testing forms the basis:
  - ▶ Strong variants are often practically infeasible
  - ▶ Robust techniques are very effective for PL's with weak typing
- ▶ Decision tables and classification trees, help us in:
  1. summarizing the logic
  2. identifying and documenting the effective methods and test-cases.

## One Sentence to Take Home

No perfect functional testing technique exists:

**classification tree** (or DT)

augmented with **coverage information** (to iteratively add test cases) should provide an effective mix.
