

System Validation: Extensions of Hennessy-Milner Logic

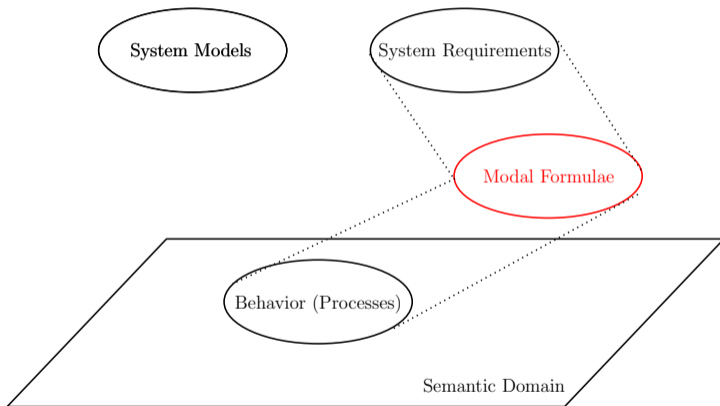

Mohammad Mousavi and Jeroen Keiren

Open
Universiteit

General Overview

Limitations of Hennessy-Milner Logic

- ▶ Properties like “the system is deadlocked” require reasoning about **all actions**
- ▶ Properties of **infinite depth** cannot be expressed, for example:

Limitations of Hennessy-Milner Logic

- ▶ Properties like “the system is deadlocked” require reasoning about **all actions**
- ▶ Properties of **infinite depth** cannot be expressed, for example:
 - ▶ all reachable states satisfy φ

$$Inv(\varphi) = \varphi \wedge [true]\varphi \wedge [true][true]\varphi \wedge \dots$$

Limitations of Hennessy-Milner Logic

- ▶ Properties like “the system is deadlocked” require reasoning about **all actions**
- ▶ Properties of **infinite depth** cannot be expressed, for example:
 - ▶ all reachable states satisfy φ

$$Inv(\varphi) = \varphi \wedge [true]\varphi \wedge [true][true]\varphi \wedge \dots$$

- ▶ there is a reachable state which satisfies φ

$$Pos(\varphi) = \varphi \vee \langle true \rangle \varphi \vee \langle true \rangle \langle true \rangle \varphi \vee \dots$$

Extending HML to Sets of Actions

For $A = \{a_1, \dots, a_n\} \subseteq \text{Act}$ with $n \geq 1$

- ▶ $\langle A \rangle \varphi$ denotes $\langle a_1 \rangle \varphi \vee \dots \vee \langle a_n \rangle \varphi$ and $\langle \emptyset \rangle \varphi = \text{false}$

Extending HML to Sets of Actions

For $A = \{a_1, \dots, a_n\} \subseteq \text{Act}$ with $n \geq 1$

- ▶ $\langle A \rangle \varphi$ denotes $\langle a_1 \rangle \varphi \vee \dots \vee \langle a_n \rangle \varphi$ and $\langle \emptyset \rangle \varphi = \text{false}$
- ▶ $[A] \varphi$ denotes $[a_1] \varphi \wedge \dots \wedge [a_n] \varphi$ and $[\emptyset] \varphi = \text{true}$

Action formula

A described using the following syntax ($a \in \text{Act}$):

$$A, B ::= \text{false} \mid \text{true} \mid a \mid \bar{A} \mid A \cup B \mid A \cap B$$

where $\bar{A} = \text{Act} \setminus A$, true matches all actions, false matches no action.

Typical Formulas

- ▶ the process is deadlocked

Typical Formulas

- ▶ the process is deadlocked

$[true]false$

Typical Formulas

- ▶ the process is deadlocked

$[true]false$

- ▶ the process can execute some action

Typical Formulas

- ▶ the process is deadlocked

$[true]false$

- ▶ the process can execute some action

$\langle true \rangle true$

Typical Formulas

- ▶ the process is deadlocked

$[true]false$

- ▶ the process can execute some action

$\langle true \rangle true$

- ▶ a must happen next

Typical Formulas

- ▶ the process is deadlocked

$$[true]false$$

- ▶ the process can execute some action

$$\langle true \rangle true$$

- ▶ a must happen next

$$\langle a \rangle true \wedge [\bar{a}]false$$

Typical Formulas

- ▶ the process is deadlocked

$$[true]false$$

- ▶ the process can execute some action

$$\langle true \rangle true$$

- ▶ a must happen next

$$\langle a \rangle true \wedge [\bar{a}]false$$

- ▶ φ holds after every step

Typical Formulas

- ▶ the process is deadlocked

$$[true]false$$

- ▶ the process can execute some action

$$\langle true \rangle true$$

- ▶ a must happen next

$$\langle a \rangle true \wedge [\bar{a}] false$$

- ▶ φ holds after every step

$$[true]\varphi \wedge \langle true \rangle true$$

Regular Hennessy-Milner Logic

Idea: use **regular expressions** inside modalities

$$\blacktriangleright \langle \varepsilon \rangle \varphi = [\varepsilon] = \varphi$$

Regular Hennessy-Milner Logic

Idea: use **regular expressions** inside modalities

- ▶ $\langle \varepsilon \rangle \varphi = [\varepsilon] \varphi = \varphi$
- ▶ $\langle \beta_1 \cdot \beta_2 \rangle \varphi = \langle \beta_1 \rangle \langle \beta_2 \rangle \varphi$
- ▶ $[\beta_1 \cdot \beta_2] \varphi = [\beta_1][\beta_2] \varphi$

Regular Hennessy-Milner Logic

Idea: use **regular expressions** inside modalities

- ▶ $\langle \varepsilon \rangle \varphi = [\varepsilon] \varphi = \varphi$
- ▶ $\langle \beta_1 \cdot \beta_2 \rangle \varphi = \langle \beta_1 \rangle \langle \beta_2 \rangle \varphi$
- ▶ $[\beta_1 \cdot \beta_2] \varphi = [\beta_1][\beta_2] \varphi$
- ▶ $\langle \beta_1 + \beta_2 \rangle \varphi = \langle \beta_1 \rangle \varphi \vee \langle \beta_2 \rangle \varphi$
- ▶ $[\beta_1 + \beta_2] \varphi = [\beta_1] \varphi \wedge [\beta_2] \varphi$

Regular Hennessy-Milner Logic

Idea: use **regular expressions** inside modalities

- ▶ $\langle \varepsilon \rangle \varphi = [\varepsilon] \varphi = \varphi$
- ▶ $\langle \beta_1 \cdot \beta_2 \rangle \varphi = \langle \beta_1 \rangle \langle \beta_2 \rangle \varphi$
- ▶ $[\beta_1 \cdot \beta_2] \varphi = [\beta_1][\beta_2] \varphi$
- ▶ $\langle \beta_1 + \beta_2 \rangle \varphi = \langle \beta_1 \rangle \varphi \vee \langle \beta_2 \rangle \varphi$
- ▶ $[\beta_1 + \beta_2] \varphi = [\beta_1] \varphi \wedge [\beta_2] \varphi$
- ▶ $\langle \beta_1^* \rangle \varphi = \varphi \vee \langle \beta_1 \rangle \langle \beta_1^* \rangle \varphi$

Regular Hennessy-Milner Logic

Idea: use **regular expressions** inside modalities

- ▶ $\langle \varepsilon \rangle \varphi = [\varepsilon] \varphi = \varphi$
- ▶ $\langle \beta_1 \cdot \beta_2 \rangle \varphi = \langle \beta_1 \rangle \langle \beta_2 \rangle \varphi$
- ▶ $[\beta_1 \cdot \beta_2] \varphi = [\beta_1][\beta_2] \varphi$
- ▶ $\langle \beta_1 + \beta_2 \rangle \varphi = \langle \beta_1 \rangle \varphi \vee \langle \beta_2 \rangle \varphi$
- ▶ $[\beta_1 + \beta_2] \varphi = [\beta_1] \varphi \wedge [\beta_2] \varphi$
- ▶ $\langle \beta_1^* \rangle \varphi = \varphi \vee \langle \beta_1 \rangle \langle \beta_1^* \rangle \varphi$
- ▶ $[\beta_1^*] \varphi = \varphi \wedge [\beta_1][\beta_1^*] \varphi$

Limitations of HML revisited

Formulas for properties that cannot be expressed in HML

- ▶ the scientist always produces a publication after drinking two coffees in a row

$$[true^* \cdot coffee \cdot coffee](\langle pub \rangle true \wedge [\overline{pub}] false)$$

Limitations of HML revisited

Formulas for properties that cannot be expressed in HML

- ▶ the scientist always produces a publication after drinking two coffees in a row

$$[true^* \cdot coffee \cdot coffee](\langle pub \rangle true \wedge [\overline{pub}] false)$$

- ▶ the scientist never drinks beer

$$[true^* \cdot beer] false$$

Limitations of HML revisited

Formulas for properties that cannot be expressed in HML

- ▶ the scientist always produces a publication after drinking two coffees in a row

$$[true^* \cdot coffee \cdot coffee](\langle pub \rangle true \wedge [\overline{pub}] false)$$

- ▶ the scientist never drinks beer

$$[true^* \cdot beer] false$$

- ▶ $Inv(\varphi)$

$$[true^*]\varphi$$

Limitations of HML revisited

Formulas for properties that cannot be expressed in HML

- ▶ the scientist always produces a publication after drinking two coffees in a row

$$[true^* \cdot coffee \cdot coffee](\langle pub \rangle true \wedge [\overline{pub}] false)$$

- ▶ the scientist never drinks beer

$$[true^* \cdot beer] false$$

- ▶ $Inv(\varphi)$

$$[true^*]\varphi$$

- ▶ $Pos(\varphi)$

$$\langle true^* \rangle \varphi$$

Limitations of regular HML

Using regular HML we still cannot express some intuitive properties:

- ▶ all computations **inevitably** reach a state which satisfies φ
- ▶ for **some** execution φ **holds everywhere**

Limitations of regular HML

Using regular HML we still cannot express some intuitive properties:

- ▶ all computations **inevitably** reach a state which satisfies φ
- ▶ for **some** execution φ **holds everywhere**

Why not use **recursion**?

- ▶ $\mathit{Inev}(\varphi)$ expressed by $X \stackrel{\text{def}}{=} \varphi \vee [\mathit{true}]X$
- ▶ $\mathit{Safe}(\varphi)$ expressed by $X \stackrel{\text{def}}{=} \varphi \wedge \langle \mathit{true} \rangle X$

Summary

- ▶ Allowing sets inside modalities \implies more compact formulas
- ▶ **Regular HML** allows describing properties of **infinite depth**
- ▶ Some desirable properties cannot be described using regular HML

General Overview

Thank you very much.
